1. The Geography of Wealth: Where the Market LivesThe city distribution pie chart reveals a massive concentration of luxury assets. Almaty is the undisputed capital of the high-end market, accounting for 50.8% of all premium listings. Together with Astana (23.7%), these two metropolitan hubs control nearly three-quarters of the entire luxury vehicle supply in the country. For a specialized dealer or a high-net-worth buyer, the market effectively begins and ends in these two cities.

2. Brand Hierarchy: The Peak of PremiumThe bar chart illustrates the prestige hierarchy by average price. Ferrari and Rolls-Royce lead the pack with average asking prices exceeding 160 million KZT. They are followed closely by ultra-luxury manufacturers like Bentley and Lamborghini. Interestingly, brands like Mercedes-Benz and Porsche appear lower on this specific list, suggesting a higher volume of "entry-level" luxury models that bring down their average price compared to the more exclusive supercar manufacturers.

3. The Timeline of Value: Pricing TrendsThe line chart tracks price volatility across different production years. There is a predictable surge for 2024–2026 models, representing brand-new inventory. However, notice the significant price peaks around 2003 and 2009. These likely represent rare "modern classics" or highly-specced collectors' items that maintain high value despite their age. This highlights that in the premium segment, "older" does not always translate to "cheaper."

4. Finding the "Unicorns": Deep-Dive SelectionThe data table provides the granular detail needed for decision-making. We can see high-value 2024 models with 0 mileage listed between 65M and 150M KZT. By focusing on these specific entries, users can identify "showroom-ready" vehicles. Applying your is_bargain logic to this table would further allow a buyer to instantly spot cars priced below the expected market average for their specific year and brand
